

02 Quiz 1

Name	Perigren, Jomar A.	Date	9/5/2024
Section	BSIT-A508	Score	

Direction: Answer each of the following questions in at least three (3) sentences. **(3 items x 10 points)**

1. Management Information Systems are used in data processed by Transaction Processing Systems. How would you compare their roles in this operation?

The main purpose of a transaction processing system is to collect and process the regular business transactions like wages, reservations, and sales. TPS performs the functions of collecting, storing, and processing data, efficiently and in real time; it is a backbone for all the other systems, which gather their data from this. While the MIS uses the data processed through TPS and generates organized reports and insights to aid managerial decision-making. On the other hand, TPS involves the intake of raw data, MIS focuses on the analysis and reporting of data to help in business decision-making.

2. Mobile Applications and Intelligent Systems are two of the most advanced information system types today. How do they differ from each other?

Mobile applications are the software developed to work on smartphones and tablets, with which users directly interact in order to be able to message, play games, or do online shopping. Simultaneously, smart systems, like AI-driven systems, can evaluate information without human interference and make decisions on their own. While mobile applications require a user to constantly interact with them, an intelligent system is able to adapt and learn itself so that it could carry on performing more complex tasks, which are automation of business processes or prediction based on data analysis. Applications can be further developed into an intelligent system but need human interactions in order to develop and implement the tasks.

3. It is stated that Office Automation Systems and Knowledge Management Systems are both used to enhance and optimize collaboration. In your opinion, which of them provides a better collaboration platform for organizations?

Office Automation Systems are all about easing the regular tasks of an office, such as maintaining emails, documents, or planning meetings to assist people in working more effectively. Knowledge Management Systems take this to the next level and are all about knowledge capture and sharing within an organization so that people learn from each other and field expertise can be shared. In my opinion, Office Automation Systems is far better than KMS when it comes to enhancing collaboration. That is due to its applications, not only can it also capture, store, and retrieve organizational data and knowledge, OAS can also be used for many ways such as online collaborations, and real-time conversations that is widely used nowadays.
